

**Amendments to the Specification:**

On page 5, please delete the "Summary of the Invention", and insert therein a new Summary of the Invention as follows:

Some embodiments provide ~~an LP~~ a linear programming ("LP") method that identifies  
5 route propagations. In some embodiments, this method is used by a router that hierarchically  
defines routes for nets within a region of a design layout. The router (1) partitions the region into  
a first set of sub-regions, and (2) for each particular net, identifies a route that traverses a set of  
the first-set sub-regions. In some embodiments, the invention's method partitions the first set of  
sub-regions into a second set of smaller sub-regions. It then identifies a plurality of propagation  
10 possibilities for propagating each route into the second set of smaller sub-regions of the first set  
sub-regions. The method next formulates ~~an a linear programming ("LP")~~ problem based on the  
identified propagation possibilities. The method then solves the LP problem.

In some embodiments, the formulated LP problem is an integer-linear-programming  
("ILP") problem, and solving the ILP problem returns integer solutions that specify one  
15 propagation permutation for each route in each first-set sub-region traversed by the route. In  
other embodiments, solving the LP problem returns real-numbered solutions. In some of these  
embodiments, the method converts the real-number solutions into integer solutions that specify  
one identified propagation permutation for each route in each first-set sub-region traversed by the  
route.
